

SYSTEM AND METHOD FOR SCALING AND REPOSITIONING DRAWINGS

ABSTRACT

A computer system and method relating to editing an electronic document having both text and drawings is disclosed. Drawings may be rescaled and/or repositioned responsive to a change in line height or font size of text. The rescaling may be done in proportion to the change in line height or font size, and the repositioning may be performed to avoid overlapping of the rescaled drawings. A document may be divided into a plurality of adjacent regions, and drawings within the document may each have an offset value representing a distance between the drawing and a reference axis of one of the regions.
